An (n, k) linear code C is called a cyclic code if every cyclic shift of a code vector in C is also a code vector. Codewords can be represented as polynomials

of degree n . For a cyclic code all codewords are multiple of some polynomial $g(X)$ modulo X^{n+1} such that $g(X)$ divides X^{n+1} . $g(X)$ is called the generator polynomial. Examples:

This book owes its beginnings to the pioneering work of Claude Shannon in 1948 on reliable communication over noisy transmission channels.

Shannon's central theme was

that if the signaling rate of the system is less than the channel capacity, reliable communication can be achieved if one chooses proper encoding and decoding techniques.

The 4B/5B block coding discussed in Chapter 4 is a good example of this type of coding. In this coding scheme,

Chapter 10 Error Detection and Correction

This thesis deals with the design of error-control coding schemes for three different problems of noisy information transmission, storage and processing.

These problems have in common that they are of interest from a practical, industrial point of view and that they cannot be solved elegantly by traditional error-control coding schemes.
