This paper develops a fundamental theory of realizations of linear and group codes on general graphs using elementary group theory, including basic group duality theory.

Principal new and extended results include: normal realization duality; analysis of systems-theoretic properties of fragments of realizations and their connections; "minimal = trim and proper" theorem for cycle-free

Since we can represent our code and how it behaves with respect to either runtime or memory space on a Cartesian Graph, it follows that there must be functions which describe how to draw such a graph. The way in which we describe how efficient our code in this way is to use “Big O” notation.
