Heterocycles are common fragments of the vast majority of marketed drugs. This is a reflection of the central role that heterocycles play in modern drug design. They can serve as useful tools to manipulate lipophilicity, polarity, and hydrogen bonding capacity of molecules, which may lead to improved pharmacological, pharmacokinetic, toxicological, and physicochemical properties of drug candidates and ultimately drugs.

• 6-membered heterocycles are in many drugs • Saturated 6-membered rings act no different than acyclic compounds • Unsaturated 6-membered rings are usually aromatic • Nitrogen containing aromatic heterocycles are weak bases with strong conjugate acids • Sulfur containing aromatic heterocycles are neither acidic or basic

**Heterocycles as Drugs and Components of Drug Structures**

Heterocycles are moieties used often as part of active pharmaceutical ingredients (APIs). The reasons for this are varied: heterocyclic fragments add to the API molecule a variety of functionalities, heteroatoms, aromatic or nonaromatic rings, and differences in basicity or hydrophobicity, all properties which can be easily modulated by the correct functionalization of every heterocyclic ring.
