Hydropower or water power is power derived from the energy of falling or fast-running water, which may be harnessed for useful purposes. Since ancient times, hydropower from many kinds of watermills has been used as a renewable energy source for irrigation and the operation of various mechanical devices, such as gristmills, sawmills, textile mills, trip hammers, dock cranes, domestic lifts, and ore mills. A trompe, which produces compressed air from falling water, is sometimes used to power othe

Farmers demand water, power for irrigation | Agra News ...

Direct effects. An irrigation scheme draws water from groundwater, rivers, lakes or overland flow, and distributes it over an area. Hydrological, or direct, effects of doing this include reduction in downstream river flow, increased evaporation in the irrigated area, increased level in the water table as groundwater recharge in the area is increased and flow increased in the irrigated area.

In this process, the surrounding water table is raised to scatter water evenly across the land. Methods like pumping stations, canals, gates, ditches, and a few other systems are used to raise the water table. This irrigation method is one of the most effective for scattering water throughout the areas with a high water table. Manual Irrigation. Water is scattered across evenly around the field with the help of manual power such as labors and watering cans.
