The kinetic molecular theory is a simple but very effective model that effectively explains ideal gas behavior. The theory assumes that gases consist of widely separated molecules of negligible volume that are in constant motion, colliding elastically with one another and the walls of their container with average velocities determined by their absolute temperatures.

The kinetic energy (KE) of a particle of mass (m) and speed (u) is given by: Expressing mass in kilograms and speed in meters per second will yield energy values in units of joules ($J = kg\ m^2\ s^{-2}$). To deal with a large number of gas molecules, we use averages for both speed and kinetic energy.

$P_t = p_1 + p_2 + \dots + p_n = \sum p_i$. For a mixture in a fixed volume at constant temperature, by $PV = nRT$ the total pressure is proportional to the total number of moles of all the gases, n_t . Likewise, the partial pressure from an individual gas in the mixture, say gas A, is proportional to its number of moles, n_A .

Students can describe how the kinetic molecular theory explains the behavior of ideal gases, and when it falls short for real gases. Students should be able to understand the concept of partial pressures and vapor pressure. They should also be able to collect gas over water and calculate the individual partial pressures of each gas.
