This book summarizes the latest advances in pain research. All the chapters were contributed by speakers from Asian Pain Symposium (APS) on Acute and Chronic Pain, which was held in Taipei in 2017. Founded in Kyoto, Japan in 2000, the APS serves as a platform for scientists to present recent findings in pain research and discuss research orientation in this field. APS 2017 focused on novel strategies for pain treatment. Written by experts from various disciplines, from molecular to functional, and from basic to clinic studies, this book is composed of 18 review articles on the physiology and pathology of pain in these research fields. Specific topics include circuitry, neurotransmitter, physiology, behavior, neuropathology, pharmacology, and the treatments for neuropathic pain disorders. The book is a valuable resource for researchers and graduate students in pain medicine and neuroscience.

The series *Advances in Stem Cell Biology* is a timely and expansive collection of comprehensive information and new discoveries in the field of stem cell biology. Recent *Advances in iPSC Technology, Volume 5* addresses the progress in induced pluripotent stem cells (iPSCs) technologies. Somatic cells can be reprogrammed into iPSCs by the expression of specific transcription factors. These cells are transforming biomedical research in the last 15 years. The volume teaches readers about current advances in the field. This book describes different technologies and strategies to use iPSCs for biological and clinical benefit. In recent years, remarkable progress has been made in the obtention of iPSCs and their differentiation into several cell types, tissues, and organs using state-of-the-art techniques. These advantages facilitated identification of key targets and definition of the molecular basis of several disorders. This volume will cover hot topics in the iPSC field, such as iPSCs for modeling the cardiovascular toxicities of anticancer therapies, iPSC differentiation through the lens of the noncoding genome, modeling of blood-brain barrier with iPSCs, mathematical modeling of iPSCs, iPSCs to study human brain evolution, self-renewal in iPSCs, differences and similarities between iPSCs and embryonic stem cells, and more. The volume is written for researchers and scientists interested in stem cell therapy, cell biology, regenerative medicine, and organ transplantation and is contributed by world-renowned authors in the field. Provides overview of the fast-moving field of induced pluripotent stem cell technology, regenerative medicine, and therapeutics. Covers the following topics: iPSCs for modeling the cardiovascular toxicities of anticancer therapies, iPSC differentiation through the lens of the non-coding genome, modeling of blood-brain barrier with iPSCs, mathematical modelling of iPSCs, iPSCs to study human brain evolution, self-renewal in iPSCs, differences and similarities between iPSCs and embryonic stem cells, and more.
