Isu de l'enseignement de g é nie civil d é livr é par l'auteur en deuxi è me et troisi è me cycles, ce manuel accompagnera tout au long de leur parcours ceux qui pr é parent une licence, un master ou un titre d'ing é nieur. Les notions abord é es ici faciliteront l'acquisition ult é rieure de connaissances nouvelles, qu'elles soient th é oriques (calcul des plaques et coques, dynamique et sismique), pratiques ou r é glementaires (b é ton arm é , construction m é tallique). On verra que l'auteur contextualise au g é nie civil le calcul des structures à poutres en é tabliissant, à l'usage des ing é nieurs, le lien entre mod é lisation et normalisation. Il classe les diff é rents types d' é l é ments de structures, pr é sente la normalisation et énonce clairement les exigences qui s'imposent à l'ing é nieur. Quant au vocabulaire sp é cifique, il est pr é cis é ment d é fini afin d'ê tre employ é avec rigueur. Ayant, d'exp é rience, conscience des difficult é s que pr é sentent toujours les é tudes de statique, l'auteur a plac é en t ê te d'ouvrage les indispensables rappels de m é canique g é n é rale : il y é voque la philosophie de la statque avant de traiter les é tudes en configuration d é form é e, puis sous l'hypoth è se des petites perturbations. Deux approches compl é mentaires du calcul de statique y sont é galement illustr é es : la classique m é thode newtonienne et, via la notion de m é canisme associ é , le calcul scolaire par application du principe des puissances virtuelles. La partie r é serv é e à la RDM porte successivement sur la th é orie des poutres de Timoshenko, la th é orie du cisaillement de flexion de Bredt-Jourouviski et la th é orie de la torsion de Saint-Venant. On y traite de notions fondamentales comme l' énergie é lastique sans ignorer les aspects complexes qu'induisent notamment les profils de section droite multiplemment connexes. Dans un chapitre enti è rement d é di é au principe des puissances virtuelles, diverses modalit é s d'application sont expos é es. Il sert de fondation aux deux grandes m é thodes de calcul des structures : la m é thode des forces et la m é thode des d é placements. Chargement thermique, pr é contrainte, prise en compte des appuis é lastiques ou des d é placements impos é s, calcul des treillis hyperstatiques : les divers cas de charge sont illustr é s et discut é s. Enfin, les questions de la stabilit é des é quilibres en r é gime é lastique des structures viennent d'ô turer l'ensemble.

This text embraces the philosophy of 'active' conservative care and a multidisciplinary team approach to treatment. It addresses site specific sports injuries, as well as diagnostic imaging, strength and conditioning, nutrition and steroid use.

This guide presents the egg and larval descriptions of 100 species of fishes belonging to 55 families, which are most likely to be present in plankton samples collected in the continental shelf and oceanic waters of the Western Mediterranean Sea. The guide is structured in two parts. The first introductory part describes the different applications of ichthyoplankton studies in fisheries research, the main sampling strategies, methods and gears, the early life history of fishes and how to identify them. A brief historical account of ichthyoplankton identification studies in the Mediterranean Sea is also provided. The second part of the guide contains the identification sheets of the species. Each species sheet includes the following information: illustration of the adult fish and information on its habitat and spawning season; description of the main features useful towards identifying the egg, yolk sac and larval stage of each fish species; illustrations and (when available) photos of the different life stages.

Take an eclectic, evidence-based approach to orthopaedic manual therapy. From theory through practical application of soft tissue and joint mobilization techniques—this comprehensive resource delivers the depth and breadth of coverage you need to optimize patient outcomes through informed clinical decision-making as part of a comprehensive intervention regimen.

Comprehensive yet practical, this book is the first of its kind to focus exclusively on both major and minor conditions affecting the pediatric cervical spine. Written by eminent orthopedic and spinal surgeons, it provides a systematic approach based on traditional categories: anatomy, pathology, imaging, and both surgical and non-surgical treatment strategies. Utilizing the most up-to-date evidence, the subject is approached in three main sections. The basic science of the pediatric cervical spine – anatomy, biomechanics, imaging and diagnostic techniques – is covered in part I. The clinical aspects of pediatric cervical spine disorders are discussed in part II, including trauma, inflammatory conditions, infections, tumors, congenital anomalies and others. The medical and surgical treatment of these disorders comprises part III, presenting conservative techniques such as immobilization and surgical techniques such as arthrodesis. Complications and other related pediatric cervical conditions are also covered in this last section. Written by an international panel of experts and skillfully edited by leaders in the field, The Management of Children's Cervical Spine Disorders is a unique and definitive resource for pediatric orthopedic spine surgeons, neurologists and all medical professionals treating these delicate conditions.

Sonar performance modelling (SPM) is concerned with the prediction of quantitative measures of sonar performance, such as probability of detection. It is a multi-disciplinary subject, requiring knowledge and expertise in the disparate fields of underwater acoustics, acoustical oceanography, sonar signal processing and statistical detection theory. No books have been published on this subject, however, since the 3rd edition of Urick ' s classic work 25 years ago and so Dr Ainslie ' s book will fill a much-needed gap in the market. Currently, up-to-date information can only be found, in different forms and often with conflicting information, in various journals, conference and textbook publications. Dr Michael Ainslie is eminently qualified to write this unique book. He has worked on sonar performance modelling problems since 1983. He has written many peer reviewed research articles and conference papers related to sonar performance modeling, making contributions in the fields of sound propagation and detection theory.
