Meaning of Secondary Metabolites: Plants produce thousands types of chemicals. Some of the organic compounds like carbohydrates, fats, proteins, nucleic acids, chlorophylls, hemes are required for their basic metabolic processes and found throughout the plant kingdom. These organic compounds are called primary metabolites or biomolecules.

Secondary Metabolite

The metabolites which are required for the growth and maintenance of cellular function are called primary metabolites, while such metabolites which are not required for the growth and maintenance of the cellular functions and are the end products of the primary metabolism are called as secondary metabolites. Microbial Metabolic products are the low molecular weight compound, necessary for the cell's or body metabolism processes.

On face value, this seems counter intuitive given the high carbon cost of isoprene biosynthesis: previously it has been suggested that synthesis of secondary metabolites at elevated CO₂ concentrations is a result of excess sucrose during protein synthesis that acts as an “energy overflow” (Lambers, 1993).

Heterologous expression of putative plant secondary metabolite biosynthesis genes in a microbe is useful to validate their functions, and in some cases, also, to produce plant metabolites in microbes.

Endophytes, the microbes that normally colonize plant tissues, may also produce the phytochemicals produced by the host plant.
