For about 15 years, the URBACT programme has been the European Territorial Cooperation programme aiming to foster sustainable integrated urban development in cities across Europe. It is an instrument of the Cohesion Policy, co-financed by the European Regional Development Fund, the 28 Member States, Norway & Switzerland.

Describe how transit agencies, metropolitan planning organizations, and state DOTs can act today to initiate or expand their analytical tools for integrated land use-transportation planning. The Guidelines are intended for the general reader having an interest in the effects of transit on land use. The Guidelines describe currently available integrated models, the characteristics of an "ideal" integrated model, and steps that a planning organization should take in order to support and expand such modeling capability.

Development projects are the building blocks of urban growth. Put enough of the right projects together in the right way, and you have sustainable cities. But getting the pieces to stack up takes a feat of coordination and cooperation. In our market economy, developers, designers, and planners tend to operate in silos, each focused on its own piece of the puzzle. Sustainable Development Projects shows how these three groups can work together to build stronger cities. It starts with a blueprint for a development triad that balances sound economics, quality design, and the public good. A step-by-step description of the development process explains how and when planners can most effectively regulate new projects, while a glossary of real estate terms gives all the project participants a common language. Detailed scenarios apply the book's principles to a trio of projects: rental apartments, greenfield housing, and mixed use infill. Readers can follow the projects from inception to finished product and see how different choices would result in different outcomes. This nuts-and-bolts guide urges planners, developers, and designers to break out of their silos and join forces to build more sustainable communities. It's essential reading for practicing planners, real estate and design professionals, planning and zoning commissioners, elected officials, planning students, and everyone who cares about the future of cities.

This book is an introduction to hydroinformatics applied to urban water management. It shows how to make the best use of information and communication technologies for manipulating information to manage water in the urban environment. The book covers the acquisition and analysis of data from urban water systems to instantiate mathematical models or calculations, which describe identified physical processes. The models are operated within prescribed management procedures to inform decision makers, who are responsible to recognized stakeholders. The application is to the major components of the urban water environment, namely water supply, treatment and distribution, wastewater and stormwater collection, treatment and impact on receiving waters, and groundwater and urban flooding. Urban Hydroinformatics pays particular attention to modeling, decision support through procedures, economics and management, and implementation in both developed and developing countries. The book is written with post-graduates, researchers and practicing engineers who are involved in urban water management and want to improve the scope and reliability of their systems.

Growing populations and rising standards of living exert stress on water supply and the quality of drinking water. This book presents aspects of challenges in the management of urban water resources, urban water supply, urban drainage and water bodies, wastewater treatment, security, and reuse. The book presents expert opinions which indicate that the way to deal with the current urban water management dilemmas is by integrated management and innovative delivery of water services.

Urban space is a commons: simultaneously a sphere of human cooperation and negotiation and its product. Understanding urban space as a commons means that the much sought-after productivity of the city precedes rather than results from strategies of the state and capital. This approach challenges assumptions of urbanization as capital-driven, an idea which resonates with a range of recent urban social movements, from the Arab Spring and the Occupy movement to the "Right to the City" alliance. However commons exist in a tense relationship with state and market, both of which continually seek to exploit and control them. Initiatives to create "commons" are welcomed and even facilitated by governments in order to (re-)valorize urban space and lessen the impacts of economic restructuring, while, at the same time, the creative and reproductive potential of the urban commons is undermined by continuing attempts to commodify them. This volume examines these topics theoretically and empirically through a wide spectrum of international case studies providing perspectives from a variety of cities as diverse as Berlin, Hyderabad and Seoul. A wider discussion of commons in current scientific and activist literature from housing, public space, to urban infrastructure, is explored through the lens of the urban condition.

This book was first published in 1983.

Excess water in the urban environment results in flooding,which causes structural damage, risks to personal safety and disruption to city life. Water is also a major contributory factor for disease transmission as well as being the medium for transport of many pollutants. These problems are of increasing concern due to climate changes and are part
