According to George Cantor (1845-1918), the founder of set theory), The individual objects of the set are its elements. A set may have no elements, in which case it is called the empty set and denoted by There is only one empty set.

Moore Chap 10. Transfinite Mathematics

In mathematics, transfinite numbers are numbers that are "infinite" in the sense that they are larger than all finite numbers, yet not necessarily absolutely infinite. These include the transfinite cardinals, which are cardinal numbers used to quantify the size of infinite sets, and the transfinite ordinals, which are ordinal numbers used to provide an ordering of infinite sets. The term transfinite was coined by Georg Cantor in 1915, who wished to avoid some of the implications of the word infi

According to transfinite set theory he will go bankrupt in the infinite limit. This result is crucial for set theory. Without it, the fundamental distinction between countable and uncountable sets would break down. The argument is simple: For every dollar we can determine the day when it will be spent.

Set theory is a branch of mathematical logic that studies sets, which informally are collections of objects. Although any type of object can be collected into a set, set theory is applied most often to objects that are relevant to mathematics. The language of set theory can be used to define nearly all mathematical objects. The modern study of set theory was initiated by Georg Cantor and Richard Dedekind in the 1870s. After the discovery of paradoxes in naive set theory, such as Russell's parado

In set theory, Zermelo–Fraenkel set theory, named after mathematicians Ernst Zermelo and Abraham Fraenkel, is an axiomatic system that was proposed in the early twentieth century in order to formulate a theory of sets free of paradoxes such as Russell's paradox.Today, Zermelo–Fraenkel set theory, with the historically controversial axiom of choice (AC) included, is the standard form of ...
