Aug 8·13 min read. Photo by Franck V.on Unsplash. In my last article on Trust in AI, I wrote about how building trust in AI needs to include both 1) the people and institutions behind the technology and AI (those selling, making, using it) and 2) the technology of AI systems and solutions. But before we run off and collectively open shop for the “trust” business or lay out a blueprint and start coding trust into our behavior or our technology, let’s take the time to understand trust.

Is Trust in AI Trustworthy?. The technology world and ...

A network around trust, technology, society and power. The Trust & Technology Initiative is a forum for interdisciplinary research from Cambridge and beyond to explore the dynamics of trust and distrust in relation to internet technologies, society and power. It is unique in considering the interplays and feedback loops between the fundamentals of technology, societal impact and governance of next generation systems at the research and development stage.

Trust & Technology Initiative

Trust and technology: in tech we trust - for now Protectionism, anti-globalization, increasing citizen dissatisfaction, the voices of populism and the erosion of trust in all areas of business and society. As a sector, technology, enjoys the highest level of trust with 76% - but trust can be lost fast and the warning signs are clear

Trust and technology: in tech we trust - for now

Trust and Technology in a Ubiquitous Modern Environment: Theoretical and Methodological Perspectives provides a variety of theoretical perspectives on the topics of trust and technology, as well as some empirical investigations into the trust-building, trust-maintenance, and trust-destroying practices in the context of technology. It presents research positioned at the intersection of the ...

Trust and Technology in a Ubiquitous Modern Environment ...

But even when the technology solution is a true “silver bullet” and can deliver perfectly on transformation’s promise, in the end success turns fully and necessarily on people. For that reason trust, not technology, is what makes or breaks transformation in manufacturing. John Sobel is co-founder and CEO for Sight Machine.

Trust Is More Important than Technology in Digital ...

When NGOs serve as the introduction point for new technology and establish a relationship of trust, they can propel technology adoption among the populations they serve. The role of trust is particularly important when dealing with the unbanked. Convincing a person to change the way they manage their money often requires a high level of trust.

Trust and Technology (SSIR)

The Reuters Institute Digital News Report suggests that in the UK there is declining trust that either government or the technology companies will act in the public interest. A well-established tactic of information warfare is to sap morale by continuous attrition through the propagation of misinformation.

Truth, Trust and Technology - so what's the problem ...

Trust in technology has been declining for several years and is highlighted by one significant data point: What can we trust is real? Seventy-six percent worry that “false information

or fake news being used as a weapon” was agreed to 76 percent of the time – that’s a 6 percent jump since 2018. In the current climate the zeitgeist is jittery.

In Technology We Trust(ed) | Edelman

Trust Technology also known as TrustTech is any type of tech that enhances and propagates trust in personal, social, and business settings. It is the creation, facilitation, stabilization, and quantification of trust between people. TrustTech facilitates dynamic systems of inter-personal relationships. It maintains the balance of community systems, as well as commercial and social relationships between people.

About us - Trusted Technology

In 2019, The Life Changes Trust and the William Grant Foundation produced a research report exploring how people with dementia and their carers engage with assistive technology. The report is called 'Dementia and Technology - A Literature Review and Qualitative Study'.

Technology and Dementia | Life Changes Trust

Trust sits at the heart of this precarious process, and the Government has very little of it – largely due to its own missteps and an embarrassing number of U-turns in the past six months. When it...

If you can't trust those in charge, who can you trust?From government to business, banks to media, trust in institutions is at an all-time low. But this isn't the age of distrust--far from

it. In this revolutionary book, world-renowned trust expert Rachel Botsman reveals that we are at the tipping point of one of the biggest social transformations in human history--with fundamental consequences for everyone. A new world order is emerging: we might have lost faith in institutions and leaders, but millions of people rent their homes to total strangers, exchange digital currencies, or find themselves trusting a bot. This is the age of "distributed trust," a paradigm shift driven by innovative technologies that are rewriting the rules of an all-too-human relationship. If we are to benefit from this radical shift, we must understand the mechanics of how trust is built, managed, lost, and repaired in the digital age. In the first book to explain this new world, Botsman provides a detailed map of this uncharted landscape--and explores what's next for humanity.

"This book brings together scholars with significantly different backgrounds who share interests in the interplay between trust and technology, presenting novel theoretical perspectives on the topics of trust and technology, as well as some empirical investigations into the trust-building, trust-repairing, and trust-destroying practices in the context of technology"--Provided by publisher.

'This is a welcome book. The issues of public understanding of science open many questions. What does "understanding" mean? How does understanding translate into attitudes towards science and trust in scientists? What is the role of the mass media? The essays in this book shed light on such questions bringing insights from several disciplines. They help to define a meaningful research agenda for the future. - Professor Dorothy Nelkin, New York University

For scholars interested in how social concepts such as trust impact on new technologies, this is undoubtedly a valuable contribution. Ian Grant, Telecommunications Policy . . . the editors have managed to provide a comprehensive overview of current conceptual and empirical research on trust-related issues from multiple perspectives. . . Trust and New Technologies is an enlightening collection of research papers on trust. The book should be of interest to scholars, practitioners and researchers focusing on the applications of new technologies in marketing and business management. Since trust also is a key concept in information behaviour studies, researchers interested in this field will also find this book a useful resource. Madely du Perez, Australian Library Journal This book is a timely collection of research papers on one of the most critical subjects on the internet. It explores a wide range of trust related issues from multiple perspectives, and by researchers from around Europe and America. The papers address the different roles that trust plays in consumer marketing in online environments, in mobile media, and in organizational relations. The issues highlighted are relevant to both academics and practitioners. Feng Li, University of Newcastle upon Tyne, UK Trust and New Technologies presents versatile new research that illustrates the different roles that trust plays in the marketing and management of new technologies. The authors provide a comprehensive and much needed overview of the current state of conceptual and empirical research in the topical area of trust and new technologies. Comprising of sixteen chapters, the book is divided thematically into three sections: consumer trust in online environments trust and mobile media new technologies and trust within and between organizations. This enlightening book will be of great interest to scholars, practitioners and research students focusing on the applications of new technologies in marketing and management. Trust researchers across business disciplines and the social sciences will also find this timely and unique book a constructive resource.

"This book brings together scholars with significantly different backgrounds who share interests in the interplay between trust and technology, presenting novel theoretical perspectives on the topics of trust and technology, as well as some empirical investigations into the trust-building, trust-repairing, and trust-destroying practices in the context of technology"--Provided by publisher.

This book encapsulates some work done in the DIRC project concerned with trust and responsibility in socio-technical systems. It brings together a range of disciplinary approaches - computer science, sociology and software engineering - to produce a socio-technical systems perspective on the issues surrounding trust in technology in complex settings. Computer systems can only bring about their purported benefits if functionality, users and usability are central to their design and deployment. Thus, technology can only be trusted in situ and in everyday use if these issues have been brought to bear on the process of technology design, implementation and use. The studies detailed in this book analyse the ways in which trust in technology is achieved and/or worked around in everyday situations in a range of settings - including hospitals, a steelworks, a public enquiry, the financial services sector and air traffic control. Whilst many of the authors here may already be known for their ethnographic work, this book moves on from accounts of 'field studies' to show how the DIRC project has utilised the data from these studies in an interdisciplinary fashion, involving computer scientists, software engineers and psychologists, as well as sociologists. Chapters draw on the empirical studies but are organised around analytical themes related to trust which are at the heart of the authors' socio-technical approach which shows the nuanced ways in which technology is used, ignored, refined and so on in everyday settings.

How the blockchain—a system built on foundations of mutual mistrust—can become trustworthy. The blockchain entered the world on January 3, 2009, introducing an innovative new trust architecture: an environment in which users trust a system—for example, a shared ledger of information—without necessarily trusting any of its components. The cryptocurrency Bitcoin is the most famous implementation of the blockchain, but hundreds of other companies have been founded and billions of dollars invested in similar applications since Bitcoin's launch. Some see the blockchain as offering more opportunities for criminal behavior than benefits to society. In this book, Kevin Werbach shows how a technology resting on foundations of mutual mistrust can become trustworthy. The blockchain, built on open software and decentralized foundations that allow anyone to participate, seems like a threat to any form of regulation. In fact, Werbach argues, law and the blockchain need each other. Blockchain systems that ignore law and governance are likely to fail, or to become outlaw technologies irrelevant to the mainstream economy. That, Werbach cautions, would be a tragic waste of potential. If, however, we recognize the blockchain as a kind of legal technology that shapes behavior in new ways, it can be harnessed to create tremendous business and social value.

Culture and Trust in Technology-Driven Organizations provides insight into the important role that culture and trust can play in the success of high-technology organizations. This book reviews the literature and results of an empirical study that investigated the relationship between mechanistic and organic cultures and the level of trust in technology-based organizations. The book outlines the literature on organizational trust and culture and the role theorists believe they play in the success of a changing domestic and global business environment. It identifies ways of defining culture and trust as well as the survey instruments used to measure them. The book then examines the results of two studies that demonstrate the connection between organizational culture and trust. The two studies were conducted at separate times using data collected from several companies within a three-hour radius of each other. These companies are highly dependent upon the ability to identify, hire, and retain highly skilled knowledge workers. These workers are critical for the companies to successfully compete within the scope of their business and expand into their current and other markets. The book provides a practitioner's guide—based on the literature review and the results of the studies examined—that can be used to assess, diagnose, and improve employees' perception of their work culture and improve trust found in organizations. This guide provides management with actions and activities that should be considered when handling the day-to-day business of the organization. If followed, these activities can be instrumental in designing a culture that leads to success and ease of operation for the organization and its members.

Erhvervsledere inden for udvikling og anvendelse af digital teknologi giver deres bud på, hvordan vi sikrer, at fremtidens teknologi bliver et gode for samfundet snarere end en trussel. Forfatterne til bogen beskriver de seks værdier, der som et kompas skal guide virksomheder, når de udvikler og anvender teknologi: åbenhed, respekt, relevans, ansvarlighed og tillid. Desuden bidrager forfatterne med overvejelser om etiske aspekter af teknologi

This study contrasts different effects of applying blockchain technology on a social norm of trust and individual behaviour. The advanced technological features of blockchain could either complete contractual information and prevent coordination failures by substituting the need for trust or allow for some degree of incompleteness in information and favour a reciprocal mechanism of trust to solve for inefficiencies arising out of it. Either way, incomplete information is a necessary condition for the emergence of social norms of trust and reciprocity; hence a change in the completion of contractual information influences the institutional setting that market mechanisms are embedded in. One evolutionary process drives both, the degree of information available and behavioural traits within the society. Technology is neutral, but the way it is applied has different consequences on the institutional setting and thus favours different individual behavioural traits. Blockchain technology might either substitute or complement the need for trust.
